Proof of Concept — Client Overview

1. Introduction

This document presents a proof of concept for **Atlas**, an enterprise knowledge platform designed for the way people actually work. Today, answering a single question often means opening many documents across wikis, file shares, and ticketing systems — and reading each one by hand. Atlas changes that experience: you ask a question once, and the platform returns a clear, consolidated answer drawn from every relevant page you are permitted to access.

The pages that follow walk through the website from a user's point of view — what you see on screen, what you do at each step, and how the platform saves time while keeping every answer traceable to its original source.

2. The challenge today

Knowledge in large organizations is spread across many tools, teams, and projects. A question such as *"What is our data-retention policy for clinical trial documents, and which projects already follow it?"* may require reading a policy page in Confluence, a guideline in SharePoint, several project charters, and a compliance tracker in Jira — often taking hours, and still leaving doubt about which version is current.

- Search tools return links, not answers — the reading and comparison is still manual.
- The same information may appear in different formats with different wording.
- New team members spend weeks learning where knowledge lives.
- Experts are repeatedly interrupted to answer questions that already exist in writing.

Before Atlas vs. With Atlas

Before — reading one by one	With Atlas — ask once
✗ Search returns 30+ links across tools ✗ Open each wiki page, PDF, and ticket ✗ Compare versions manually ✗ Spend hours; still unsure which is current ✗ Answer depends on who you ask	✓ Ask one question in plain English ✓ Atlas reads every relevant page for you ✓ Receive one clear, consolidated answer ✓ Every claim linked to its source ✓ Consistent, traceable, permission-safe

Figure 1. Before Atlas, people read documents one by one. With Atlas, they ask once and receive a consolidated answer.

3. What Atlas offers

Atlas is a scalable, extensible platform that **centralizes knowledge across domains and projects**. It connects to your existing systems — wikis, document stores, file shares, and ticketing tools — and builds a unified knowledge layer behind a simple web experience. You do not need to know where a document lives; you simply ask your question in plain English.

Your journey in four simple steps

Figure 2. The user journey in four steps: sign in, ask, review, and verify.

What makes Atlas different:

- **One question, one answer** — Atlas searches all connected sources and synthesizes a single summary.
- **Every claim is cited** — You can open the original page behind any statement.
- **Your permissions are respected** — You only see content you are already allowed to read.
- **Built to grow** — New sources and business domains can be added without rebuilding the platform.

4. Using the Atlas website — step by step

The following sections show the main screens a user would encounter. Each illustration reflects the intended experience for the proof of concept.

Step 1 — Open Atlas and sign in

You open Atlas in your web browser and sign in with your company account (single sign-on). No new password is required.

The home page welcomes you with a search bar and a short summary of what Atlas can do. You can see which knowledge sources are connected and confirm that your existing access permissions apply.

Figure 3. The Atlas home page — a single search bar spans all connected knowledge sources.

Step 2 — Ask your question

Type your question in everyday language — the same way you would ask a colleague. You do not need to choose which system to search.

Optional filters let you narrow the scope by domain, project, or time (for example, "current policy only"). When you press **Ask**, Atlas searches every connected source at once.

The screenshot shows a web browser window with the URL `https://atlas.company.internal`. The page title is "Atlas — Unified Knowledge Platform". The navigation bar includes links for "Home", "Ask Atlas" (which is underlined), "Browse", "My History", and "Help".

Step 1 — Ask your question in plain English

A text input field contains the question: "What is our current data-retention policy for clinical trial documents, and which projects already implement it?". A blue "Ask" button is positioned to the right of the input field.

Optional filters

Below the question field, there are three filter buttons:

- Domain:** A dropdown menu with "Clinical Operations" selected.
- Project:** A dropdown menu with "All projects" selected.
- Time:** A dropdown menu with "Current only" selected.

What happens next?

1. Atlas searches across Confluence, SharePoint, file shares, and Jira simultaneously.
2. It reads and compares the most relevant pages — you do not need to open them yourself.
3. Within seconds, you receive one consolidated answer with links to every source used.

Figure 4. The user enters a question in plain English and optionally applies filters.

Step 3 — Read the consolidated answer

Within seconds, Atlas presents a single, readable answer — not a list of links. The response combines information from every relevant page and presents it in clear, formal English.

Numbered citations appear inline. A confidence indicator shows how well the available sources support the answer. If sources disagree or one project is behind on compliance, Atlas says so explicitly.

Figure 5. One consolidated answer with inline citations — no need to open dozens of documents.

Step 4 — Verify sources and open originals

Click any citation number to open a panel showing the source documents Atlas used. Each entry includes the document title, where it lives (Confluence, SharePoint, Jira, and so on), when it was last updated, and the exact passage that supports the answer.

You can open the original page in one click whenever you need full context or want to share a direct link with a colleague.

The screenshot displays the Atlas Unified Knowledge Platform interface. At the top, the browser address bar shows `https://atlas.company.internal`. The navigation bar includes links for Home, Ask Atlas (highlighted), Browse, My History, and Help. The main heading is "Step 3 — Verify sources with one click".

On the left, under "Answer (summary)", the text reads: "...15 years after study completion..." and "Projects ALPHA-204, BETA-117...". Below this text are two numbered buttons, 1 and 2, with button 2 being highlighted.

On the right, under "Sources (4 documents)", four sources are listed, each with a title, source, update date, a snippet of text, and an "Open original" link:

Step 5 — Browse by domain or project (optional)

If you prefer to explore before asking, the Browse page lists the domains and projects Atlas knows about — along with how many pages are indexed in each area.

Selecting a domain pre-fills your next question so answers stay focused on the area you care about.

Figure 7. Users can browse knowledge by domain and project, or ask across the entire organization.

5. What changes for you

Today	With Atlas
Search returns many links; you open and read each document.	You receive one consolidated answer with citations to expand.
You reconcile conflicting documents manually.	Atlas highlights conflicts and shows which source is most recent.
Knowledge is siloed by team and tool.	One question spans every domain and project you can access.
Answers depend on who you ask.	Answers are consistent, grounded, and fully traceable.

6. What the proof of concept will demonstrate

The proof of concept is a time-boxed demonstration on a representative slice of your organization's knowledge. It is designed to prove the core user experience before a wider rollout.

- A working web experience like the screens shown in this document.
- Connection to two or three representative sources (for example, a wiki, a file share, and a ticketing system).
- Cross-document answers with inline citations on real content from one or two priority domains.
- Permission-aware retrieval — users only see what they are entitled to read.
- A measured quality report and a plan for scaling to all sources and domains.

Ask once. Receive one clear, consolidated, trustworthy answer — across every domain and project.

7. Recommended next steps

To proceed with the proof of concept, we recommend the following:

1. Confirm two or three representative knowledge sources and one or two priority domains.
2. Identify a small working group: a product owner, a subject-matter contact per domain, and an IT/security contact.
3. Approve a time-boxed POC with access to a secure environment in your cloud or VPC.
4. Review the working demonstration, quality report, and production rollout plan at the end of the POC.

Atlas turns fragmented documents into a single, trustworthy answer — so your teams spend less time searching and more time acting on what they learn.
